

| Key vocabulary    |  |
|-------------------|--|
| force             | A force is a push or a pull.   |
| magnetic force    | An invisible force that attracts magnetic metals.  |
| magnet            | Magnets attract magnetic materials. Iron, nickel, cobalt and materials that contain these (e.g. stainless steel) are magnetic. |
| attract           | To pull towards.   |
| repel             | To push away.  |
| poles             | Magnets have two poles, a north pole and a south pole.   |
| contact force     | Many forces need contact to act:<br>          |
| non-contact force | Magnetic force does not need contact and can act at a distance.  |

### Objects moving on surfaces:

Ice skates have a sharp blade. This helps them move better on ice.

It is much harder to walk on ice in trainers.

A bowling green is closely mown so the grass is short and the balls roll easily.

## Forces and magnets – Year 3

| Significant scientist  |   |
|--|---|
| <b>Michael Faraday (1791-1867)</b><br> | Michael Faraday was an English scientist. In 1831, he discovered electromagnetic induction. This was a very important discovery for the future of science and technology. |

| Types of magnets:   |   |
|---|---|
| <b>Bar</b><br>    | <b>Ring</b><br>      |
| <b>Button</b><br> | <b>Horseshoe</b><br> |

### Magnets have two poles

Opposite poles attract

Same poles repel

A magnet attracts magnetic materials.

| These metals are magnetic:  |  |
|---|--|
| <b>iron nails</b><br>      | <b>nickel</b><br>50p coins contain nickel<br> |
| <b>stainless steel</b><br> | <b>steel</b><br>                              |

We can sort and classify materials as:

| Magnetic objects   | Non-magnetic objects   |
|--|--|
|  |  |

A magnet does not need to touch an object to attract it.
